Welcome to our 18th Annual Terminal Sire Sale.

For us, despite the market conditions, this is our business “as usual”. Our point of difference is the consistency and constitution of our bulls. These young sires are bred initially for our own use, to provide the 1500+ venison weaners we finish each year. They have wintered for two years in their age group mobs – this year’s mob came through on swedes and silage, and then were drafted from the main group in mid-December after velveting.

Once again we are also making available a line of sires from another system. We select our top growth rate stags from our 1500 finishing deer, using the weights from weaning until the start of the chill trade. We sort through these, use the top 20 ourselves as spikers and again at 2 years old, and now the best of these are available today in the sale. They have no recorded sire/dam information, but have the constitution, conformation and recorded growth, to breed you venison for the chill trade.

Maximise your opportunities with a new sire

For new deer farmers, or those who have purchased a sire from us, we offer a few suggestions or general comments that may assist in a successful mating and maximum return on your investment. Good animals are worth looking after!

As deer have strong social structures in their groups they will be a degree of stress in taking young stags from their mobs and comfort zone and transporting them to a new environment. This can be minimised with understanding and common sense. Ideally if an animal is transported with a familiar stag from his home he will shift more easily. Sounds like a ploy to increase sales, but multiple animals certainly settle more quickly.

If you shift a single animal, relocate them to a small group of preferably lesser aged males ie. spikers or 2yr olds. Failing that, a quiet mob of hinds and fawns is often available for that first introductory period. A paddock where the sire can settle under trees or at least away from major vehicle disturbance is ideal. Our animals are run in large groups, quite extensively, so may take a week or two to settle to an urban environment.

Some young elk and wapiti type sires can be intimidated and dominated by smaller but more aggressive older red stags, even in adjoining paddocks, so mating or locating them away from older sires often works best. If you multiple mate your sires we find it is desirable to match stags of equal age or size so that one doesn't dominate for more than one cycle.

After the rut in early May our policy when removing Wapiti type sires is to run them into the shed and administer a drench whether they look under parasite stress or not. Recent research by the Elk Wapiti Society of New Zealand, and Invermay has shown drench resistance in some worms, particularly Ostertagia to moxidectin chemicals. Injectable products have greater efficacy, but do not be complacent with your parasite management in deer. Seek advice if you are unsure.

As with other deer species, elk and wapiti can suffer from low trace element levels that may not affect sheep and cattle, such as copper, cobalt, zinc, and selenium. Regular soil or animal testing and remedial supplementation is important.

Some bloodlines of deer show greater susceptibility to grass staggers. Prevalence of higher endophyte levels in late summer and autumn prior to the rut can ruin your mating program.

Feed your sires extra in that early winter period before the real cold sets in, as recovered energy and body mass will assist the worn out stag to recover for velvet growth and the next mating.

3 YR SIRES
